CAPSTONE PROJECT (CS-69099-001)

KENT STATE UNIVERSITY

Department of Computer Science

1 Motivation

The project aims at building an elastic web application that can automatically scale out and scale in on-demand and cost-effectively by using cloud resources. The resources used were from Amazon Web Services. It is an image recognition application exposed as a Rest Service to the clients to access.

2 Objectives

The application takes the images and returns the predicted output by the deep learning model by using the AWS resources for computation, transportation, and storage. So the tasks involved designing the architecture, implementing RESTful Web Services, a load balancer that scales in and scales out EC2 instances at App Tier according to the demand of the user.

3 Milestones

The initial milestones involve

- To design the architecture
- To explore the AWS services.
- Then, Build an Architecture.
- Make appropriate changes to the flow of architecture.
- Finally, Testing and Evaluation.

4 Tools

- AWS services (EC2, SQS, S3, IAM).
- AWS Image Recognition library ()
- Web Services (HTML, CSS, JS).
- Testing for resources.
- Python/Java for backend of the architecture.
